

For use in South and West Hertfordshire

Position Statement: Treatment of diabetic hypos in primary care with prescribed products

Herts Valleys CCG **does not** support prescribing of products to treat hypos: Purchase of a food product to treat hypos is recommended instead

Recommendations:

1. Do not prescribe high glucose products to treat hypos
2. Instead recommend any of the following purchased products as hypo treatments and recommend:
 - Knowing the person's preferences (as that will influence what they will take) e.g. 200ml orange juice, a few jelly babies, glucose tablets or a high sugar (not diet) drink
 - Having the persons choice of product available at any time in case of a hypo
3. Recommend that patients/parents/carers plan ahead in order to effectively treat a hypo

The following table demonstrates **which readily available, purchased products can be used to treat a hypo and how much of each is required to provide 15g fast acting carbohydrate:**

Product (in order of cost)	Amount required for 15g fast acting carbohydrate	Approx cost per 'dose' (15g fast acting carbohydrate) (prices correct March 2019)*	Can be purchased from:	Sold as:
	If you can't measure how much to take, taking more than recommended to treat a hypo will not be harmful
